

# Carebot L2 Support Engineer - Assignment

## How to Submit

Please use **Git** for version control while working on this assignment.

When you are finished, you can submit your work by providing a link to a Git repository.

Include your written answers for **Task 1** and **2** as a Markdown file (e.g., `answers.md`) at the root of your repository, alongside your code for **Task 3**.

## Task 1: Incident Triage

As an L2 Support Engineer, you will face multiple issues at once. You need to assign a severity level (**Critical, High, Medium, Low**) to the following incoming tickets based on standard SLA logic (Impact vs. Urgency).

**Briefly explain your reasoning for each:**

1. **Hospital A:** Doctors report that no AI predictions have been returning for the last hour. Patients are waiting.
2. **Internal Team:** The Carebot analytics dashboard (used by our sales team) is loading very slowly.
3. **Hospital B:** We are receiving a recurring error for one specific, rare type of X-ray format. All other standard X-rays are processing correctly.
4. **Hospital C:** Our monitoring shows the on-premise Gateway is offline. This hospital is currently closed and goes live with our system tomorrow morning.

## Task 2: Communication

**Context:** It is 15:00. Our L1 partner forwards you an urgent ticket:

**Subject:** URGENT: Hospital XYZ - Doctors not receiving AI results

**Description:** Hi L2 team, doctors at Hospital XYZ just called. They uploaded about 20 X-ray scans via their autorouting platform in the last 45 minutes, but none of the AI predictions are showing up. They need this fixed ASAP.

You check our monitoring dashboard (Grafana) and observe the following:

- **Gateway Status:** Online and healthy. CPU and RAM usage are very low (idle).
- **Last Received Scan:** 14:15 (45 minutes ago).

You pull the recent logs from the receiver container on the hospital's Gateway:

JSON

```
[14:12:05] [INFO] Scan received from Hospital Autorouter.  
Processing...  
[14:12:15] [INFO] Analysis complete. Results successfully sent back.  
[14:15:00] [INFO] Heartbeat check to Hospital Autorouter API: Status  
200 OK  
[14:30:00] [INFO] Heartbeat check to Hospital Autorouter API: Status  
200 OK  
[14:45:00] [INFO] Heartbeat check to Hospital Autorouter API: Status  
200 OK  
[15:00:00] [INFO] Heartbeat check to Hospital Autorouter API: Status  
200 OK
```

### Questions:

1. Based on the monitoring and logs, where is the most likely point of failure? Explain your logical deduction.
2. Since we do not have direct access to the hospital's internal systems, what specific information or action do you need to request to move this investigation forward?
3. Write an email reply to the L1 partner. Explain your findings clearly, reassure them about the status of our platform, and give them actionable instructions on what to check next on their/the hospital's end.

### Task 3: Automation & Infrastructure

**Context:** Managing our on-premise Gateways requires automation to ensure consistent and reliable deployments. In this task, we want to see your practical scripting and configuration management skills.

#### Your Tasks:

1. Write an Ansible playbook to install and configure an **Orthanc DICOM server** running inside a Docker container. The Ansible playbook should be designed to run locally.
2. Create a simple Bash script ([setup.sh](#)) that prepares the runtime environment required to execute your Ansible playbook, and then runs the playbook itself.
